# libminer
<!-- badges: start -->
```

```
<!-- badges: end -->
The goal of libminer is to provide an overview of your R library setup. It is a toy
package created as a part of a workshop and not meant for serious use.
## Installation
You can install the development version of libminer from [GitHub](https://GitHub.com/) with:
# install.packages("devtools")
devtools::install_GitHub("ateucher/libminer")
## Example usage
To get a count of installed packages in each of your library locations,
optionally with the total sizes, use the `lib_summary()` function:
```{r example}
library(libminer)
lib_summary()
specify `sizes = TRUE` to calculate the total size on disk of your packages
lib_summary(sizes = TRUE)
```

## build\_readme()

```
check()
install()
```

## commit

return to slides

## **Continuous Integration**

```
use_github_action()

## **Design Principles**

Refactor this function to add 2 helper functions

```
lib_summary <- function(sizes = FALSE) {
 pkgs <- utils::installed.packages()
 pkg_tbl <- table(pkgs[, "LibPath"])
 pkg_df <- as.data.frame(pkg_tbl, stringsAsFactors = FALSE)
 names(pkg_df) <- c("Library", "n_packages")

if (sizes) {
 pkg_df$lib_size <- map_dbl(
 pkg_df$Library,
 \(x) sum(fs::file_size(fs::dir_ls(x, recurse = TRUE))),
)
 }
 pkg_df
}</pre>
```

into:

```
#' Generate a dataframe of installed packages
#'
#' @return dataframe of all packages installed on a system
lib <- function() {
 pkgs <- utils::installed.packages()
 as.data.frame(pkgs, stringsAsFactors = FALSE)
}

#' calculate sizes
#'
#' @param df a data.frame
#'
#' @return df with a lib_size column
#' @noRd
calculate_sizes <- function(df) {
 df$lib_size <- map_dbl(</pre>
```

```
df$library,
 ~ sum(file_size(dir_ls(.x, recurse = TRUE)))
)
df
}
lib_summary <- function(sizes = FALSE) {
 pkg_df <- lib()
 pkg_df <- table(pkg_df$LibPath)
 pkg_df <- as.data.frame(pkg_df, stringsAsFactors = FALSE)
 names(pkg_df) <- c("Library", "n_packages")

if (sizes) {
 pkg_df <- calculate_sizes(pkg_df)
 }
 pkg_df
}</pre>
```

## check, commit and push
